#### **CPIC Updates**

Clinical Pharmacogenetics Implementation Consortium (CPIC) guidelines are published in full on the PharmGKB website (www.pharmgkb.org). Relevant information will be periodically reviewed and updated guidelines will be published online.

#### **Focused Literature Review**

We searched the PubMed database (1966 to October 2011) for keywords ((HLA OR HLA-B OR HLA-B58 OR HLA-B\*5801) AND (allopurinol)), and retrieved fifty articles. Of those fifty the majority were review articles. We identified nine primary studies of the pharmacogenomics of allopurinol hypersensitivity and one meta-analysis. The recent meta-analysis of HLA-B\*5801 and allopurinol-induced SJS/TEN(1) stated that in their literature review they found only six relevant primary studies in their database search that included MEDLINE, Pre-MEDLINE, Cochrane Library, EMBASE, International Pharmaceutical Abstracts (IPA), CINAHL, PsychInfo, the WHO International, Clinical Trial Registry, and ClinicalTrial.gov from their inceptions to June 2011(2-7). The additional three studies we have included in our corpus of literature include those that used a genome-wide association study (GWAS) design and were published after June 2011(8-10).

To construct an HLA-B\*57801 minor allele frequency table based on ethnicity, allele frequency information was obtained from Allele Frequency Net Database (www.allelefrequencies.net). It is an online repository for HLA allele frequencies from both previously published and unpublished sources. All previously published data were manually checked against the original publications to verify the HLA-B\*5801 allele frequencies. In some cases, sample sizes or allele frequencies were updated to reflect only subjects successfully genotyped for HLA-B\*5801 (rather than the total sample size of the study) or to correct errata in the original publication. The combined analysis included 38979 Caucasians, 5811 Black or Africans, 882 Middle Easterners, 3318 Hispanic or Latino and 11531Asians.

### **Genetic Test Interpretation and Available Test Options**

Commercially available genetic testing options change over time. Several platforms based on different genotyping technology that may assist in evaluating options are available and are described on the Pharmacogenetic Tests section of PharmGKB (http://pharmgkb.org/search/geneticTestList.action).

The commercial testing for HLA-B\*5801 appears to be less widespread in availability at present than that of HLA-B\*5701 (the allele associated with abacavir hypersensitivity). Testing procedures are similar than for HLA-B\*5701(11) and may include sequencing or sequence specific priming PCR. Commercially available genetic testing options change over time.

Example CPT codes from Immunogenetics laboratory, Puget Sound Blood Center, USA are 83890, 83894 (x32), 83898 (x32), 83912.

#### Levels of Evidence linking genotype to phenotype

The evidence summarized in Supplemental Table S4 has been graded using the threetiered system required by the Clinical Pharmacogenetics Implementation Consortium(12), as modified slightly from Valdes *et al.*(13):

**High:** Evidence includes consistent results from well-designed, well-conducted studies.

**Moderate:** Evidence is sufficient to determine effects, but the strength of the evidence is limited by the number, quality, or consistency of the individual studies, generalizability to routine practice, or indirect nature of the evidence.

**Weak:** Evidence is insufficient to assess the effects on health outcomes because of limited number or power of studies, important flaws in their design or conduct, gaps in the chain of evidence, or lack of information.

Every effort was made to present evidence from high-quality studies, which provided the framework for the strength of therapeutic recommendations in Table 2.

#### **Strength of Recommendations**

The dosing recommendations are simplified to allow rapid interpretation by clinicians, as adapted from the rating scale for evidence-based therapeutic recommendations on the use of allopurinol. As previously described for CPIC guidelines(12), three categories were chosen for recommendations: strong, where "the evidence is high quality and the desirable effects clearly outweigh the undesirable effects"; moderate, in which "there is a close or uncertain balance" as to whether the evidence is high quality and the desirable clearly outweigh the undesirable effects; and optional, for recommendations inbetween strong and weak where there is room for differences in opinion as to the need for the recommended course of action. CPIC's dosing recommendations are based weighing the evidence from a combination of preclinical functional and clinical data, as well as on some existing disease-specific consensus guidelines. Overall, the dosing recommendations are simplified to allow rapid interpretation by clinicians.

A: Strong recommendation for the statement

B: Moderate recommendation for the statement

C: Optional recommendation for the statement

Supplemental Table S1. Frequencies of alleles <sup>1</sup> in major race/ethnic groups <sup>2</sup>			
Population Group	Total patients	Average HLA-B*5801 carrier frequency (%)	
Asian	11531	6.1	
Black or African American	5811	4.3	
Caucasian	38979	0.75	
Hispanic or Latino	3318	1.2	
Middle Eastern	882	3.7	

<sup>&</sup>lt;sup>1</sup> average allele frequencies are reported based on the average from the actual numbers of subjects with each allele reported in multiple studies.

Supplemental Table S2---detailed file table of HLA-B\*5801 alleles in defined race/ethnic groups

 $<sup>^{\</sup>rm 2}$  Race/ethnic group designations correspond to those indicated in Supplemental Table S2
